### Camera Interface Details (continued)

**Maximum line scan rate:** the maximum trigger frequency, or the maximum line scan rate for this DCF is equal to the sum of the video valid (LVAL) and the maximum line delay or  $136.6 \mu\text{s} + 4.9 \mu\text{s}$ . This maximum line scan rate is for a MCLK frequency of 30 MHz. The MCLK frequency can be reduced by a user through Matrox Intellicam, thereby changing the maximum line scan rate.

**Maximum line delay:** the maximum line delay (the period between the rising edge of EXPOSURE1 and the rising edge of HSYNC) is an inherent characteristic of the camera and determined to equal  $4 \mu\text{s} + 11\text{MCLK} + 4\text{MCLK} + 400\text{ns}$

$$= 4 \mu\text{s} + 0.37 \mu\text{s} + 0.13 \mu\text{s} + 400\text{ns} = 4.9 \mu\text{s}$$

**Camera and Object set-up:** As discussed in the camera manual, it is important to note that the object must pass in front of the lens parallel to the direction of the TDI stage shifts. And that while passing between the blue scan area and the red scan area the object should not move in a lateral direction any more than 1 pixel.

The number of TDI stages can be selected by controlling the user bits of the Genesis (STGSEL bit on camera) either via Matrox Intellicam, Genesis Native Library or MIL digitizer control, or by adjusting the rotary switches (JU1 and stage selection switch) located on the camera. See the camera manual for more information.

#### Mode 2: Fixed line scan rate mode

- The line scan rate is programmable and controlled by changing the Timer1 setting in the EXPOSURE SIGNAL menu in Matrox Intellicam.
- The exposure time is the period between the rising edges of the EXPOSURE1 (EXSYNC) pulses.
- The default exposure time for this DCF is  $\approx 165 \mu\text{s}$ .

- To modify the exposure time, reduce or increase the inactive period of the EXPOSURE1. **Note**, it is important that the period of EXPOSURE1 signal be longer than the video valid output + the video valid output time. The exposure pulses can be easily changed with either Matrox Intellicam, Genesis Native Library function **imCamControl()** or with the MIL digitizer control function **MdigControl()**. Refer to the appropriate manual or user guide for additional information.

# Application Note:

DALSA CL-T3-2048A

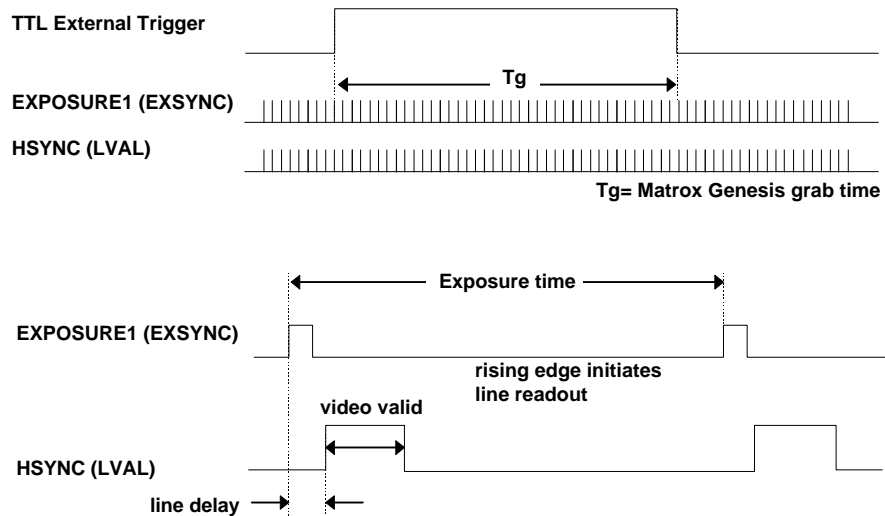

June 12, 1998

### Camera Interface Details (continued)

**Maximum line rate, Max. line delay, and Camera & Object set-up:** are the same as for *Mode 1: Variable line scan rate mode*

#### Mode 3: Fixed line scan rate and variable frame size mode

- Number of lines per virtual frame is determined by external trigger period (lines are grabbed only when trigger is active). To change the number of lines per virtual frame, reduce or increase the active period of the TTL external signal; lines are grabbed only when trigger is active. Virtual frame size is 640 lines maximum (minus the 160 unusable lines) for this DCF and is dependent upon the trigger active (high) period.
- The line scan rate is fixed and controlled through Matrox Intellicam (Timer1 setting in EXPOSURE SIGNAL), Genesis Native Library function **imCamControl()** or MIL Digitizer control function **MdigControl()**. Refer to the Intellicam, Genesis Native Library or MIL command reference for additional information.
- The exposure time is the period between both rising edges of the EXPOSURE1 (EXSYNC).
- The default exposure time for this DCF is  $\cong 165\mu\text{s}$ .
- To modify the exposure time, reduce or increase the inactive of Timer1 setting within the EXPOSURE menu of Matrox Intellicam. Note, it is important that the period of the EXPOSURE1 (EXSYNC) signal be longer than the video valid output delay + the video valid output time. Increasing the exposure time will decrease the total number of lines grabbed.
- The pixel clock supplied by the camera is 15 MHz.
- The TTL external trigger is input on the Matrox Genesis via the analog video input connector trigger pin.
